Segfault

• LOB에서는 입력된 값이 버퍼오버플로우를 일으키게 되면

segmentation fault (core dumped)

라는 메시지를 띄우며 코어파일을 생성한다.

• 그러나 항상 띄우는 것이 아니다.

• 이러한 코드가 있다. 그러면 스택에는

```
높은주소
buffer[16]
SFP
RET
```

이런식으로 자리를 잡게 된다. 여기서 buffer의 크기보다 입력된 값의 크기가 더 크면 BOF가 일어나게 된다. 입력한 값이 16byte의 버퍼를 채우면 정상적으로 종료된다. 입력한 값이 16byte를 넘어가게 되면 어떤일이 일어나는지 gdb를 사용하여 알아보았다.

```

(gdb) q
```

• HEX값으로 전달해도 0x00이 들어간다.

Why?

• 32bit운영체제를 기준으로 buffer가 16byte일 때 20byte의 문자열을 입력하게 되면 0x00까지 포함하여 사실상 21byte를 채우는 것으로 보인다.

● 그러면 buffer 16byte를 채우고 sfp 4byte, RET 1byte를 침범한다. 문자열의 끝값을 나타내는 0x00값이 RET주소를 침범하게 되어 segmentation fault를 띄우고 core를 생성하는 듯 하다.
